

“Longitudinal studies by Harvard University confirm that learning additional languages *increases critical thinking skills, creativity, and flexibility of the mind in young children.*

Pupils who learn a foreign language *outscore their non-foreign language learning peers in verbal and maths standardised tests*

indicating that learning additional language is a cognitive activity not just a linguistic one.*”

*Children's brains are naturally primed to acquire any language **effortlessly** from birth to age 6.*

Studying another language boosts creativity, self-esteem, listening skills and native-language vocabulary as well as test scores in various subject areas.**

At **Compass**, we spend 20 minutes per week in large group Spanish with our Spanish teacher, plus 20-30 minutes per week participating in small group Spanish learning activities in the classrooms.
